

**Instruction:** You may use a scientific calculator, but NOT any other electronic devices.

1. (10 points) 33% of all people living in South Korea have contracted COVID at least once. Each year, POSTECH accepts about 330 new freshmen. Estimate, up to three decimal places, the probability that at least 200 new freshmen have never contracted COVID before.
  2. (10 points) After an exam in a probability & statistics class, you want to know what the average score of the class is. You ask five randomly selected students from the class, and their scores are 78, 95, 64, 53, and 81. Assuming that the exam scores are approximately normally distributed, estimate, up to one decimal place, a 95% confidence interval for the average score.
  3. You arrived at a busy restaurant, where all tables are taken. Fortunately, there is only one person in front of you waiting for a table. On average, one table becomes available every 7 minutes.
    - (a) (5 points) Let  $T$  be the number of minutes it takes for the next table to become available. Find the probability density function of  $T$ . (Hint. Let  $N(t)$  be the number of tables that become available in  $t$  minutes. What distribution does  $N(t)$  have?)
    - (b) (5 points) What is the probability that you will have to wait for more than 10 minutes?
